

IN THE SPECIFICATION

Please replace the paragraph beginning at page 2, line 26, with the following replacement paragraph:

21 --For example, one method used in the prior art for displaying text character data on an output device is illustrated in Figure 2. In procedure 210, it is first determined whether the specified font is resident on the output device. If the specified font is resident on the output device, in procedure 220 the text string is sent to the printer ~~with the~~ along with the name of the specified resident font. However, if the specified font is not resident on the output device, in procedure 230, the user-specified characters are sent to the printer and are then displayed using a default resident font set defined within the printer. In many common printers, the default resident font set is specified to be the "Times Roman" font set. Thus, the prior art methods often result in output displayed on the printer or other output device that does not reflect the way the user specified the display or the way the display appears to the user on the screen. In other words, in the prior art, what the user sees is not necessarily what the user gets.--
